

Project Design Phase-II

Customer Journey Map

Date: 01 October 2026

Team ID: SWTID-2026-9532

Behaviour: APPROVAL

Project: Standard Laptop Procurement Automation in ServiceNow

Persona: Hardware Technician — IT Hardware Fulfilment

Scenario: Ordering, approving and fulfilling a Standard Laptop

Based on the project workflow, not customer interviews.

	Entice	Enter	Engage	Exit	Extend
	How does the technician first encounter the request?	How does the technician enter the fulfilment process?	How does the technician work on the task?	How does the technician complete the fulfilment?	What supports future fulfilment work?
Steps	Approved laptop request becomes visible as a fulfilment need.	Receives the approved request/task through ServiceNow.	Reviews the request details and prepares to configure the laptop.	Completes the assigned task and records the outcome.	Uses the completed workflow as a reference for later requests.
Interactions People / Places / Things	Requester submits; Approver approves; ServiceNow creates the task.	ServiceNow Service Catalog, Requested Item and Catalog Task records.	Hardware team checks the assigned task, request details and required action.	Updates task information and closes the task after fulfilment.	Requester can view status; technician has a consistent task record.
Goals & Motivations	Help me identify approved requests without searching multiple records.	Help me receive only work that is ready for Hardware fulfilment.	Help me see the Requested Item, approval and [DESC TEXT] in one task.	Help me update and close the task with a clear completion state.	Help me use a consistent process for future laptop requests.
Positive Moments	Approved requests are clearly routed into fulfilment.	Task is automatically created after approval.	Hardware assignment and [DESC TEXT] are already populated.	Closure provides a clear end to the fulfilment activity.	Consistent records improve visibility of previous fulfilments.
Negative Moments	Manual handoff can make the next action unclear.	A delayed or missing task would delay Hardware action.	Incomplete task details can require follow-up with the requester.	Incorrect updates can make the actual fulfilment state unclear.	Repeated manual handling can create inconsistent records.
Areas of Opportunity	How might we make approved requests immediately visible?	How might we ensure every approved request creates the correct task?	How might we provide all required configuration details in the task?	How might we make updates and closure simple and traceable?	How might we reuse the same automated workflow for similar items?
