

## Project Design Phase-II

# Solution Requirements — Functional Requirements

Date: 01 October 2026

Team ID: SWTID-2026-9532

Behaviour: APPROVAL

**Project: Standard Laptop Procurement Automation in ServiceNow**

### Functional Requirements

The following functional requirements define the expected behaviour of the Standard Laptop procurement automation in ServiceNow.

| FR No. | Functional Requirement (Epic)    | Sub-requirements (2-3)                                                                                                                                                                                     |
|--------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FR-1   | Standard Laptop Request          | 1. The Standard Laptop catalog item is available under Hardware. 2. The requester can submit a Standard Laptop request. 3. A Requested Item is created for the submitted request.                          |
| FR-2   | Approval Processing              | 1. The submitted request enters the approval process. 2. The approver can approve or reject the request. 3. The approval outcome is stored with the request.                                               |
| FR-3   | Flow Automation                  | 1. The Service Catalog event triggers the Standard Laptop task flow. 2. The flow proceeds to task creation only when approval is Approved. 3. The flow invokes Create Catalog Task for the Requested Item. |
| FR-4   | Catalog Task Creation            | 1. One Catalog Task is created for the approved Requested Item. 2. Set the short description to [DESC TEXT]. 3. Set the task approval state to Approved.                                                   |
| FR-5   | Hardware Assignment              | 1. Assign the created Catalog Task to the Hardware group. 2. Preserve the Requested Item reference. 3. Make the task visible to the Hardware team.                                                         |
| FR-6   | Rejected Request Handling        | 1. Detect a Rejected approval outcome. 2. Do not create a Catalog Task for a rejected request. 3. Keep the rejected approval/request status available for review.                                          |
| FR-7   | Technician Task Update & Closure | 1. The Hardware technician can update task information during fulfilment. 2. The technician can complete the configuration work. 3. The technician can close the Catalog Task after fulfilment.            |

# Project Design Phase-II

## Solution Requirements — Non-functional Requirements

Date: 01 October 2026

Team ID: SWTID-2026-9532

Behaviour: APPROVAL

Project: Standard Laptop Procurement Automation in ServiceNow

### Non-functional Requirements

The following non-functional requirements define measurable quality expectations for the proposed ServiceNow solution.

| NFR No. | Non-Functional Requirement | Testable Requirement                                                                                                                                                                         |
|---------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NFR-1   | Usability                  | A requester can locate the Standard Laptop catalog item through the Service Catalog and submit a request without using a separate procurement application.                                   |
| NFR-2   | Security                   | Only authorized ServiceNow users with the required roles and permissions can access relevant records and configuration. The flow runs as System User.                                        |
| NFR-3   | Reliability                | For an approved Standard Laptop request, the configured flow creates the expected Catalog Task with [DESC TEXT] and Hardware assignment. For a rejected request, no Catalog Task is created. |
| NFR-4   | Performance                | The flow uses the Service Catalog event path rather than periodic polling. Execution behaviour is verified in the target ServiceNow instance without inventing a numeric target.             |
| NFR-5   | Availability               | The solution remains usable while the required ServiceNow instance, user access, supported browser and stable internet connection are available.                                             |
| NFR-6   | Scalability                | The configuration can be extended to additional catalog items, routing conditions or task fields without replacing the basic ServiceNow workflow architecture.                               |
| NFR-7   | Maintainability            | The flow name, trigger, approval condition, action and task field mappings are identifiable in ServiceNow so an authorized administrator can maintain the configuration.                     |
