

Project Design Phase Proposed Solution

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Date: 01 October 2026

Team ID: SWTID-2026-9532

No.	Template Parameter	Project-specific response
1	Problem Statement	After approval, creating and assigning the Hardware fulfilment task requires a separate action. This creates an avoidable handoff between approval and Hardware work.
2	Idea / Solution	Use ServiceNow Flow Designer so that The flow creates the task on submission and sets Approval to "Approved". The created Catalog Task carries the short description "Laptop needs to Configured" and is assigned to the Hardware group.
3	Novelty / Uniqueness	Business rule: can automate the action but requires scripting and is less visual. UI action: depends on user interaction and can be bypassed. Flow Designer fits this case through low-code configuration and visible execution history.
4	Social Impact / Customer Satisfaction	Requester: reduces uncertainty by creating a traceable fulfilment task after the workflow event. Hardware team: reduces manual task creation and assignment. Approver: keeps the approval decision connected to the fulfilment process.
5	Business Model	Applicable as an internal IT service-automation solution. The same pattern can support other standardized hardware requests, such as a Standard Monitor, using catalog-specific conditions and task details.
6	Scalability	The flow structure can be extended to additional hardware catalog items, assignment groups and task fields. Example: Standard Monitor can use the same approval-to-task pattern with its own configuration description.
